DATE: 15/12/16

AGE: 68 YEARS

SEX: FEMALE

REPORT FOR CT SCAN OF THE HEAD/ ORBIT

Serial axial CT Scan of the brain showing normal grey-white matter differentiation. Normal sulci and gyri and normal ventricular system.

There is a large 3.0x1.8cm ill defined and irregular hypodensity in the left parieto-occipital region due to an infarct. There are also smaller hypodensities in the left basal ganglia and external capsule region due to infarct. Overlying sulci and gyri are effaced. There is a smaller 2.0x1.0 cm acute infarct in the right and left corona radiata. Oedema is noted in the occipital lobes. Other microinfarcts seen in the brain and brain stem bilaterally.

No evidence of intracranial haemorrhage seen. No intracranial mass or shift of the midline seen. No abnormal contrast enhancement seen in the brain.

Both extra-ocular muscles are normal. No retrobulbar masses seen. No mucosal thickening is seen in all paranasal sinuses.

IMPRESSION: Bilateral chronic occipital lobes infarcts with oedema.

Acute left parieto-occipital region corona radiata infarcts.

Left basal ganglia and external capsule region infarct

Bilateral chronic brain and brainstem microinfarcts.

No intracranial haemorrhage or mass seen in brain and orbits.
